Financial Sector Assessment Program for Islamic Financial System (iFSAP)

Financial Sector Assessment Program for Islamic Financial System (iFSAP)

Dadang Muljawan¹

Abstract

The FSAP, initiated by the IMF and the World Bank, has been implemented internationally including the IDB and IFSB member countries. The initiative is beneficial to further improve the quality of the financial industry as well as to contribute to the global financial stability. The rapid growth of Islamic finance internationally poses new challenges to the supervisory authority particularly with the growing significance of the newly developed industry. Operationally, the development of the Islamic financial industry should fulfill certain criteria in promoting operational soundness and efficiency. The initiative on iFSAP is deemed very crucial for providing appropriate understanding on how the Islamic financial system can deliver benefits and compatible to the international financial stability initiatives. The implementation of iFSAP in further instances may provide developmental view to the financial authorities in particular countries operating Islamic financial system. To address this issue, the IRTI-IDB has been trying to formulize the contents of the iFSAP that are beneficial to complement the FSAP initiative so that the assessors of the FSAP would have a standard guidance to carry out the initiative. The paper provides the methodology and the areas of the assessment in the iFSAP.

Key words: Financial assessment, regulation and stabilityJEL: G15, G18, G28 and H12

1. Introduction

The Islamic financial industry has developed rapidly in the last two decades that has been taking place not only in the Muslim predominated countries, but also in the nonpredominated Muslim countries (Mersch 2010). The presence of Islamic financial industry can be seen in African countries, Middle-eastern countries, South Asian and South-East-Asian countries, and some European countries. The Islamic financial industry has become more significant than the previous and starts to play significant role in the economic development. The development has been taking place in terms of business volume, the variety of products offered, institutional development, and regulatory framework. In most instances, Islamic financial institutions have started to complement the conventional products i.e. banking products, capital markets, insurance (takaful), pawnshop, microfinance, and Islamic social sector (zakat, infaq, sadaqah and waqaf). The Islamic banking industry has even been offering technology intensive products to entertain the customers with the equally friendly and sophisticated products as of the conventional counterpart. Despite a relatively smaller market share; in some

¹ Senior Economic Researcher, Research Division, IRTI-IDB

countries, the Islamic financial industry acquires relatively higher rate of growth showing a potential of the industry to further develop in years to come. Some countries have put the development of the newly established industry within its national agenda that could potentially complement the existing financial system, including the issuance of dedicated acts for Islamic banking, takaful and capital market. Besides accommodating the demand of the local market, some countries also look forward to benefiting from the growth of the industry internationally.

Besides offering benefits, the development of Islamic financial system poses more challenges to the financial authority that is in the position to maintain stability in the financial system including the Islamic financial system stability. Islamic financial industry as a part of the global financial system requires a standardized and internationally recognized set of regulations. Many countries have tried to develop their own regulatory framework applied to the Islamic banking operation along side with the conventional counterpart. The development may vary from one country to others since they have to accommodate its operational characteristics resulting from different interpretation on sharia issues. One country may have a set of permissible products, which may not be acceptable to other countries. The operational differences will then lead to different permissible sharia financial products (Jobst, 2007)². That has been the main reason for having a number of international initiatives seeking for a higher level of compatibility of the Islamic financial operation and eventually the international regulatory framework. An international initiative has established number of international institutions to help the industry achieve a higher level of regulatory convergence. There are AAOIFI, IFSB, IIFM and IILM dealing with accounting standard, prudential regulations, financial product development and liquidity market development respectively. Internationally, the development of the regulatory framework should also be convergent with the international initiatives aiming at achieving a required level of financial soundness like the Financial Sector Assessment Program (FSAP).

The paper proceeds as follows. Section 2 reviews the existing FSAP initiative by the IMF and the World Bank. Section 3 reviews the relevance of the FSAP to the Islamic finance and the initiatives for the Islamic financial industry. Section 4 discusses the areas of the assessments. Section 5 discusses the implementation of the iFSAP. Section 6 concludes the paper.

2. A brief about the FSAP

The FSAP initiative is a joint program developed by the IMF and the World Bank to help strengthen the financial system. The pilot program was launched in 1999 and has gone through reviews and updates until the formal document was launched in 2005. The objective of the FSAP program is to achieve an integrated analysis of stability and development issues in the financial system at the country level that will contribute to the global financial stability by using a variety of assessment tools and methodologies³. The implementation of FSAP offers benefits in some areas (World Bank and IMF, 2005). First, it allows the government to analyze issues relating to the stability and development of the financial system by using a standardized method of assessment. Second, as the

² Different interpretation would somehow lead to the legal uncertainty in the area of cross-border Islamic financial activities.

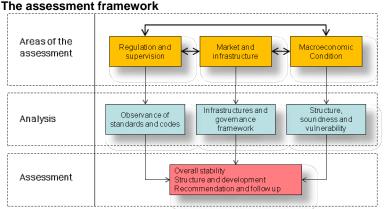

³ By year 2009, 40 countries, which are IDB and IFSB member countries, have completed the assessment process with more members are underway.

result of assessment process, the government can identify the points of vulnerability of the financial system. Third, the government can also detect the weakness of the financial system. Lastly, based on the identification and analysis conducted, the result of the assessment process serves as the basis for policy formulation aiming at strengthening the infrastructure needed for improving the financial stability in the long run including its capability to withstand any adverse effect resulted from external shocks possibly happen in the future. The FSAP states that a sound and well functioning financial system is supported by three pillars to sustain orderly financial development and stability which relate to the macroeconomic factors, regulatory and supervisory framework, and the infrastructures.

- Pilar I : Macroprudential Surveillance and Financial Stability
- Pillar II : Regulatory and Supervisory Framework of the Financial System
- Pilar III : Financial system infrastructure

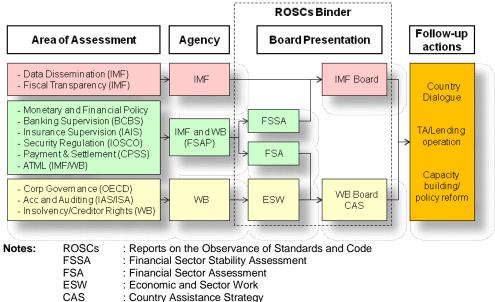

The three assessment pillars are consolidated into the final assessment reflecting the overall stability of the financial system, and current financial structure and stage of development.

Exhibit 1

Based on the assessment process, the document will also offer the recommendation and followed up actions (see Exhibit 1). As illustrated in the Exhibit 2, the FSAP is conducted by the IMF and the Bank to compliment the reports put forward for the board presentation under the ROSCs binder. As the follow-up, the assessment committee will suggest programs which generally cover continuous country dialogue, technical assistance and lending operations, and capacity building and policy reforms. The technical assistance program would accommodate country specifics which are unique. With the growing significance, the assessment of the soundness of the Islamic financial system becomes more important than the previous since the new system provides benefits to sustain the economic development and potential risk in the case of operational failures. The inclusion of the assessment of the Islamic financial system within the 3 pillars of the assessments could help the financial authority assure that the Islamic financial system fulfills the essential requirements to contribute to the financial stability in general. Those requirements for the Islamic financial system are supposed to be compatible with the existing financial assessment framework in order to arrive at an accurate consolidated picture.

Exhibit 2 FSAP and ROSCs

This assessment process can also be considered as the step to integrate the Islamic financial system into the global financial system by assuring the compliance with international prudential measures and the sharia principles at the same time.

3. The iFSAP studies

The prudential regulatory framework has been one of the central themes after the recent financial crises. Most of the countries have participated in the Bank-Fund Financial Sector Assessment Program (FSAP) in order to have a comprehensive assessment process of financial stability and development needs of the financial system around the world. The governments allowing the Islamic financial institutions to operate needs to assure this new system operate within the prudential corridor. Senior representatives from the IFSB, IMF and IIFM have taken an initial step to discuss on the assessment methodology and to see the possible level of formality of the assessment process in country level agenda⁴. The initial discussion is followed-up by the IRTI-IDB study to review the methodology and procedures used in the Bank-Fund FSAP in order to identify the areas where additional guidance and benchmark would be helpful to FSAP assessors in order to assess the development and stability of the Islamic Financial Services Industry (IFSI)⁵.

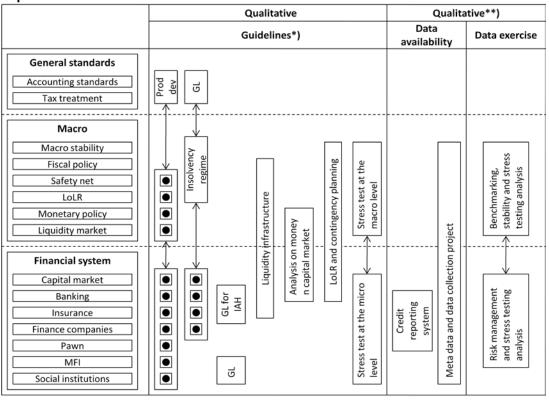

The last studies regarding the possible implementation of iFSAP has provided a bird eye view of gaps occur between the existing FSAP assessment methodology and the existing measures in the Islamic financial industry (see **Exhibit 3**). There are three main areas discussed in the studies comprising general standards applied, macroeconomic and microeconomic analysis. The first issue discusses about the standards applicable

⁴ The IDB-World Bank Working Group on Islamic Finance (WGIF) met in Jeddah during January 24-25, 2009 to initiate the discussion with other stakeholders of the IFS industry.

⁵ IRTI-IDB, in collaboration with Centennial Group, has produced an initial document titled Towards Developing a Template to Assess Islamic Financial Services Industry (IFSI) in the Bank-IMF Financial System Assessment Program (FSAP).

for accounting system, financial reporting and tax treatment so that the industry can optimally achieve its operational efficiency, prudence and eventually level of playing field. The accounting standard applicable to the Islamic finance should show itself to be reliable to promote transparency and good governance besides capable of accommodating its operational peculiarities. There is a need to translate those characteristics into clear financial profiles properly so that the financial authority can provide appropriate treatments. One of the important examples is the relation between the financial properties and solvency regime that relates the sharia properties into financial claims that link public funds to the bank capital and the financial safety net program. The studies found the needs to have adequate guideline on the tax treatment and accounting standard. This would lead to foster product innovation beneficial to all financial players, such as banking, capital market or even the government and central bank when it comes to sukuk issuance.

Gaps identified in the FSAP initiatives for Islamic finance

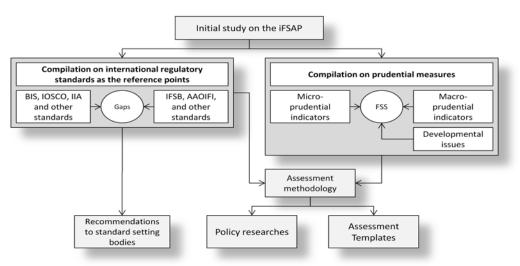

*) Assessment based on compliance *)

** Assessment based on the reliability of data and analysis

At the micro level, an international initiative, led by IFSB, has been trying to fill the gaps in the field of prudential standards such as the modification on capital adequacy standard applicable to Islamic banks, risk management, good governance, codes of business conducts etc. However, the implementation is not on the compulsory basis. It allows some modifications based on national discretion, whichever considered best fit its condition. Despite its efforts to keep on achieving its target to better equip the market, much still remains. The standards issued require more technical note so that it can achieve its practical benefit. The technical note should serve to explain how the prudential measures describe financial condition precisely in terms of liquidity figures, potential risk faced by the financial institutions. Since the Islamic financial institutions face different frontiers of transactional modes, there is a need to develop suitable methodologies applicable for risk identification, measurement, mitigation techniques, and monitoring. At the macro level, the challenges lie on the capability to interpret the financial figures resulted from the risk assessment process; and, to consolidate the financial figures of the Islamic financial sector into the mainstream. The analysis would cover the areas of liquidity market, Lender of the Last Resort facility, stress-testing analysis and its financial robustness against any possible shocks.

Having the initial iFSAP study in hand, the phase II study explores 2 major areas: potential absorbance of international best practices set in the regulatory standards and the prudential measures allowing the supervisors to always maintain the financial soundness (see **Exhibit 4**). In the area of regulatory standards, the study focuses on the compilation process of the main documents on the international regulatory standards issued by the conventional bodies and the international standard setter for Islamic finance. This compilation process is aimed at identifying the existing gaps that should be filled up by the Islamic regulatory setting bodies so that it could serve as reference points when the financial supervisor put it as the reference points. The regulatory framework covers the banking industry, capital market, insurance, social sector, accounting standards and other aspects relating to the infrastructural development.

The compilation on prudential measures involves the analysis on the financial indicators at the micro level as well as at the macro level. The financial indicators at the micro level concern about the operational sustainability of the financial institutions. The indicators at the macro level concern about the financial stability and systemic costs, particularly when encountering an adverse condition. In an addition to the stability issues that are the main focus of the FSAP, the study also put developmental issue since most of the Islamic financial system is still as the developing stage. In this follow up stage, the initiative also elaborates the assessment methodology that combines the issues on the absorbance of the regulatory framework and the issues on the financial stability which involve the quantitative aspects. The study serves as the continuation of the previous one seeking for possible steps to fill up the gaps. The steps will cover the followings:

- 1. The compilation of the international regulatory standards as the reference points for regulatory absorbance. This includes the conventional and Islamic regulatory standards.
- 2. Identification of possible indicators applicable for Islamic finance prudential measures at both micro and macro levels.

The study aims at providing a comprehensive picture of Islamic finance architecture benefiting in several fronts as follows:

- 1. It provides a bird-eye view of the Islamic financial system within the global financial market. This describes the potential differences as well as the common ground of the regulatory framework of the two systems
- 2. It provides a converged view on how Islamic finance could contribute to the financial robustness as a whole, particularly when it comes to the assessment process.
- 3. It provides some analytical grounds for the governments that wish to develop Islamic finance within its jurisdictions; whilst, maintaining its financial soundness and operational efficiency.

4. The areas of the assessment

4.1. Financial stability assessment

The financial stability assessment involves the analysis on macroeconomic and financial market development, macro prudential framework, macro financial linkage and key policy issues supporting the financial stability. The involvement of the Islamic financial system in the macroeconomic analysis depends upon the level of significance of the Islamic finance in one particular country. Other issues reflecting the country specific may also be added up to the analysis to arrive at wider perspectives and understanding upon the stage of development.

Macroeconomic and financial development

A dedicated analysis on the vulnerability of the Islamic financial system would be important to compliment the overall analysis assuming that the Islamic financial system would have different dynamics in responding to the financial disturbance. A dedicated reporting system compiling Islamic financial data and information would be important for the analysis since it enables the authority to look into the Islamic financial system independently before have it consolidated into the national financial analysis. The dedicated reporting system is expected to have the same level of operational reliability in terms of data accuracy and time lag.

Macro-prudential surveillance framework

Financial Stability Indicators

The IFSB has initiated the establishment of internationally compatible Islamic financial indicators (IFSB, 2007)⁶. The financial data and information complements the IMF

⁶ During the development of the compilation guide, the IFSB technically collaborated with the IMF to assure the compatibility. The IFSB had been a member of CCE reference group who are responsible for developing the metadata.

Financial Stability Indicators (FSI) (IMF, 2006) arriving at better understanding of the dynamics of the Islamic financial system. The financial authority need to start to identify the Islamic financial data which was compiled from the market through dedicated reporting system. The prudential data set represents the potential financial disturbance directly caused by the lack of operational soundness performed by the financial institutions. Some of the data set is totally the same with the conventional counterpart, whilst some of those are set with necessary adjustments like capital adequacy standard and prudential reserves allocated to the profit sharing investment account holders. Like the IMF-FSI data set, the IFSB financial data set put more attention to the three major financial industries: Islamic banking, takaful industry and Islamic capital market (particularly sukuk). The analysis should also include the role of sukuk in supporting debt sustainability of the government as another pillar serving as financial resources for development. Islamic financial industry should be able to set a proper methodology for the stress testing representing the level of the system robustness to withstand any possible and unexpected financial shock in the future. The result of the stress testing should also be compatible and complimentary to the stress testing process of the financial system as a whole. Complementing the existing dominating institutions, there is also one segment of the Islamic financial industry that is supposed to play significant role in the development of the Islamic financial industry i.e. Zakat-Infag-Sadagah and Wagaf (ZISW) system. As mentioned in the earlier, the ZISW system could enhance the outreach of the system by providing low cost funds and infrastructure so that the system can serve the low income society more effectively. An efficient informational system allowing cross sectors information exchange could even leverage the benefit of the ZISW funds when the facilities are combined by other facilities provided by other Islamic financial sectors.

System focused stress testing

The implementation of stress testing may adopt two different approaches: top-down and bottom-up. The stress test at the aggregate level may also involve variety techniques and toolboxes (Blaschke et.al, 2001). Top-down approach estimates the effect by using aggregate data, whilst bottom-up approach estimates the effect by using individual institutions' portfolios. Having proposed by its member countries, the IFSB has also come up with a set of principles outlining the essential components in conducting stress testing at both institution level and systemic level. This helps the supervisory authority assure the Islamic financial industry operates within the acceptable prudential corridor which involves variables having different intensity from those of the conventional. Bottom-up stress testing would allow the financial authority to capture specificities in the Islamic finance.

Analysis of macro-financial linkages

Effect of FS on macroeconomic development

An analysis on specific sector where the Islamic banking starts to show its significance may be done to see the potential effect of the Islamic banking problem to those particular economic sectors. Second linkage is the trade finance that showed a dramatic falls during the period of financial crisis which eventually affect the pace of economic development. The magnitude of the impact linked to the lack of insurance when it was needed, to herd behavior (among banks, official export credit agencies, and private insurers), and to weaknesses in domestic banking systems. This would involve the analysis of takaful industry when its presence becomes financially significant. Another linkage comes from the function of banking institutions as the monetary transmission channel by the central bank. If there is any significant problem occurs in the banking industry, it could disrupt its capacity of the central bank to perform its function effectively. The analysis would have to take account of financial structure, including the relative importance of market and bank financing, the role of foreign banks in financial intermediation, and the central bank operating procedures. As a part of banking industry, Islamic banking may also be used as a channel of monetary transmission. The analysis involves the innovation of Islamic monetary instruments and its effectiveness in supporting efficient monetary policy.

Effect of FS on debt sustainability

Debt servicing problem in Islamic finance might take a different shape since there exist share based instruments besides fixed income instruments. If the share based instruments is more dominant, debt servicing problem will be less intensive. However, the choice is up to the market players depending upon the level of transparency and market discipline in the market. Debt servicing problem on government is caused by deterioration of the government's balance sheet and unsustainable debt ratio which could create a severe impact on the whole financial system since its key role of the government securities as a risk-free assets, as a store of collateral, and as liquid assets. Macroeconomic variable such as interest rate and exchange rate may also be significant factors causing problem in debt sustainability. Therefore, the government and the monetary authorities should take concerted and credible actions to assure since debt sustainability and macroeconomic sustainability are mutually reinforcing. The assessment of debt sustainability and monitoring the two-way linkages between financial system soundness and financial soundness of nonfinancial sectors are keys to fostering financial stability. In a separate analysis, the debt sustainability is analyzed on the sukuk market for countries that have utilized sukuk as one of the fiscal instruments globally as well as domestically. Assuming that the level of demand could be different, the government should have sufficient knowledge about the market to come up with the planning for an efficient composition of issuance government sukuk and bonds.

Effect of FS on growth and financial development

Financial soundness gives positive effect to the economic growth. The soundness of financial system is comprised of stability and the development of the market to facilitate the real economic activities. To that extent, Islamic finance assures that all the financial transactions have direct links to the economy. In many countries, the development involves the size of the banking system and the liquidity of stock markets which each positively linked with economic growth which lower external financing constraints impeding corporate and industrial expansion. The last financial crises proves that although the financial development can foster the development, the financial authorities should assure the prudential part of the development since fast growth of the financial market can make it vulnerable to shocks and putting constraints to the economic output. Specifically, the financial regulatory authorities need to distinguish to what extent a rapid financial sector growth reflects improvements in access to finance and to what extent the growth reflects a loosening in risk management practices and supervision. Islamic finance may have a greater chance to reduce the market volatility since it does not involve with the speculative transactions that do not have direct link to the economy.

Other topics relevant to the financial stability analysis

International financial centers (IFC) and offshore financial centers (OFC)

Islamic banking and finance may also a part of financial services offered in the IFC and OFC. The objective of offering the Islamic finance is similar to the conventional i.e. providing more flexibility to the global players. The presence of the IFC and OFC may offer economic benefits, but it may be an additional source of instability for the host economy. The hosting countries should have a financial surveillance that is capable of conducting analysis covering the complex structure of the key financial institutions operating in an IFC and the operations in which those institutions are engaged so people can understand the sources of the risks and the transfers of risks within and from the IFC.

Capital account liberalization

The choice of capital control regime has a significant effect on the way that external shocks are transmitted to the domestic financial system (including the Islamic financial industry) and to the macro-economy. Some evidences show how capital account liberalization can provide the economy with natural adjustment and minimize the potential of having speculative attacks. However, the liberalization process requires a thorough consideration and process on the capital account on domestic financial stability

Key policy issues and policy priorities to support financial stability

The policy actions cover four key areas: macroeconomic, institutional, regulatory or supervisory, and structural. The financial authorities of related jurisdictions are in a position to formulize policy tools with appropriate mix and timing to address the vulnerability which combines the analysis of risks and vulnerabilities with the assessment of various financial policy responses and policy frameworks. Priorities in financial policy development need to be put to the Islamic financial industry. The rapid grow of Islamic financial institutions in several countries need to be facilitated by proper regulatory and supervisory frameworks. The new financial industry also needs to be supported by infrastructure including efficient settlement system and safety net.

4.2. Financial structure and development assessment

The Islamic financial system is also expected to deliver efficient financial services to all market segments and sectors of economy. Technically, the scale and the scope of activities affect the level of operational efficiency. Since the Islamic financial industry is relatively new, different paces of development may occur in different subsectors. In most cases, Islamic banking is usually the most developed followed by the Islamic capital market, takaful industry and other subsectors.

Quantitative benchmarking

Quantitative benchmarking for Islamic financial industry may use the structure of IFSB prudential data for financial data comparison. Some of them already use the GDP for unit of comparison. Quantitative benchmarking normally takes three main areas for comparison i.e. business volume as the measure of efficiency as a function of economic of scale, operational sustainability and efficiency in terms of profitability and the networth level (solvability) in terms of capital. This quantitative benchmarking analysis may also be used to measure of the level of significance of the Islamic banking operations in one particular financial jurisdiction

<u>Review of legal, informational, and transactional technology infrastructures for assess</u> and development

The Islamic financial industry need to translate this internationally accepted standards within its operations so that the integration into the global financial market and contribute to the global financial stability. The Islamic finance embraces sharing principle in some of the financial transaction which may be less applicable in the conventional system. The supervisory authority need to define those transactions into the operating regulations at micro and macro level effectively. This adoption would bring legal consequences to other legal aspect like bankruptcy law. The recognition of the Islamic financial operations needs to take place in some relevant legal structures like company law, trade law besides directly related laws like banking act, capital market act and insurance act.

The existence of informational infrastructures is aimed at reducing asymmetric information between borrowers and lenders. The information required covers transparency in borrowers' financial statements enables lenders to assess borrowers' creditworthiness on present and past financial and operational performance, and readily available credit information on borrowers enables lenders to assess borrowers' creditworthiness according to their past performance within the financial system. The effectiveness of the financial reporting should also be supported by sufficient accounting and auditing rules and practice, plus the legal and organizational requirements for public or private credit registries and property registries. In addition to that, the presence of rating agency may be relevant in more-advanced, middle-income countries. The Islamic financial system is even in a deeper need for this informational infrastructure to minimize potential moral hazard in the share based financial contracts. In some country, the Islamic financial system uses the same credit information exchange facility with some slight modification in the financial data structure to make the transparency and market discipline work. Development assessment includes evaluating the effectiveness of the check and money transfer system in terms of time and cost, and access to the financial systems. The payment system should be flexible to facilitate the transaction within the whole financial system including the Islamic financial system. A reliable payment system is also critical to sustain the function of central bank in conducting monetary policy and performing its function as Lender of the Last Resort (LOLR) for both the conventional and the Islamic banks by using appropriate instruments

Sectoral development review

Banking

Banking industry plays significant role in economic development particularly in most developing countries through intermediation process. An effective banking system is normally characterized by considerable depth; breadth in terms both of customer base and of product range; and efficiency. Similarly, the development of Islamic financial industry is normally led by a significant development of Islamic banking industry. Some financial indicators like overhead costs, income spreads, and profit margins may also indicate the level of operational efficiency.

 Quantitative benchmarking – The comparison is made between Islamic bank and conventional banks, and cross-country analysis. It should be able to explain not only the level of operational efficiency but also the decomposing factors pointing out on the roots of the deficiencies in the system. One indicator must be able to be decomposed into other factors such as profit margin is decomposed by overhead cost, loan-loss provision, reserve requirements, taxes and the profits. The level of access to banking services may be assessed by using the physical presence (geographical spread of branch offices and ATM) and the virtual presence (level of internet access and the availability of mobile banking services to the community).

- Scope of activities The assessment on the scope of activities is aimed at assuring the synchronization between the risk taking activities and the regulatory framework applied (a level of playing field). Each country may adopt different operational segmentation of Islamic banking operation e.g. whether adopting a universal banking framework or segmenting the investment banking and commercial banking criteria. This assessment also identifies the existence of near-banking activities which potentially magnify the financial disturbance within the system. Different financial institutions may converge to providing similar financial products as the result of stiff business competition. The assessment should also consider the competition between conventional and Islamic banking.
- Competition and market segmentation The level of competition may be indicated by the number of the players operating within the market. However, relating to the analysis of scope of activities, the level of competition may also come not only from the banking institutions but also from other financial companies offering almost the same financial products like insurance companies or other institutions that used to be the outsiders before the financial innovation become advanced. The level of competition, in turn, would determine the behavior of the banking institution particularly in composing its investment portfolio. High competition would lead the players to become more aggressive in approaching the market.
- Taxation issue Taxation issue cover direct and indirect taxation impacts on the operational efficiency. Direct taxation issue is relating to the deduction of taxable income by the provision of earning asset losses and possible double taxation problem to the trade based assets. This requires sufficient understanding on the Islamic financial transactions when it is implemented in the tax law. Indirect taxation issue is relating to reserve requirement determined by the central bank.

Near banking institutions

There are financial institutions operating in the society to provide alternative financing. The financial institutions can take form of finance companies that can be seen as an annex to the commercial banking system and some smaller scale near-banks may have sufficient development importance to call for special treatment. Some smaller near-bank institutions consist of specialized microfinance firms, cooperative credit unions, specialized mortgage banks, and government sponsored specialized development intermediaries. This calls for a special regulatory framework due to its financial characteristics particularly when the activities involve the deposit taking activities. Some of the institutions are operating for non-profit motif and some of them operate in very small business activities.

Takaful and collective funds

Takaful companies provide risk-reduction instruments on the liabilities side and conduct long-term funds management. Some investments of the takaful industry are usually placed in terms of bank deposits or in terms of unit trust, therefore it is necessary to have a cross-sector review to assess inter-relation among the possible connected sectors. Takaful and collective investment funds operations often overlap in the area of pension fund management. Takaful companies may sell pension policy or manage pension funds and so do the fund managers. The assessment process may also cover the available range of products and its pricings, and its relation to the regulatory framework, level of competition, organizational capacity, and existing skills in the industry.

Securities market

The assessment of the Islamic capital market needs to look at the quantitative measures describing the depth and liquidity of the market. The depth and liquidity are fundamentally affected by the variety of Islamic financial instruments available in the market (i.e. fixed income and equity types of instruments, including any possible sharia compatible derivative products) and transaction cost. In most countries, the domestic sukuk market is often less developed than the Islamic equity market due to some weaknesses. Active issuance of government sukuk can have a significant influence on the functioning of the sukuk market by helping provide the benchmark needed to price more risky securities and beneficial to the monetary policy management. An efficient capital market requires a cost-effective infrastructure including proper design of the trading platform and the regulatory burden. The ultimate goal of the capital market should be providing an optimal way of giving local firms and investor access to liquid securities markets

The demand-side reviews and the effect of finance on the real sector

The demand side review is conducted to assess the demand for and access to financial and credit services by listed companies including corporate and micro entrepreneurs ideally from different economic sectors and business lines. An analysis on the demand side may be conducted for Islamic financial system to indicate the development trend and its sustainability. The financial authority may need to assess the awareness level of the public towards the Islamic financial system.

4.3. Evaluating financial sector supervision: banking, insurance and securities market

The soundness of the financial system depends upon the effectiveness of the financial sector supervision. The FSAP framework emphasizes at the legal, institutional and policy framework of the 3 sectors i.e. banking, securities market and insurance. Besides the implementation of the relevant regulatory framework, the effective supervision requires some preconditions covering: the provision and consistent enforcement of business laws, good corporate governance, including adoption of sound accounting, auditing, and transparency procedures that carry wide international acceptance and that promote market discipline, appropriate systemic liquidity arrangements, and adequate ways to minimize systemic risk. As the part of the overall financial system, the analysis of Islamic financial system has also come into picture covering the same aspects of the assessment.

Legal and institutional framework for financial supervision

Financial sector supervision is one of the center points of the assessment process of the financial soundness. The supervisory framework should be able to maintain systemic stability by providing a safe mechanism of exit for the Islamic financial institutions that do not meet the soundness criteria. Effective supervisory activities for Islamic financial institutions needs proper legal framework empowering the supervisors to ensure that rules and regulation are effectively implemented by the market players. The key laws cover the law governing the central bank, banking and financial institutions, capital market laws, and insurance laws, and those laws are backed by adequate provisions on

the efficient and reliable payment system infrastructure. Those key laws should clearly recognize the Islamic financial operations. The legal and institutional framework should cover: the identity of the supervisor, the authority and processes for the issuance of regulations and guidance (including the governance in sharia fatwa issuance), the authority and tools to monitor and verify compliance with the regulations and principles of safe and sound operations, the authority and actions to remedy, enforce, take control, and restructure, and the procedures to de-license and liquidate problem institutions that cannot be restructured. It should define the roles and responsibilities of institutions involved in the supervision activities. They are regulatory governance, regulatory practices, prudential, and financial integrity and safety net arrangements.

In order to maintain the soundness and robustness systematically, the Islamic financial system needs proper designed safety-nets which cover efficient liquidity support, deposit insurance scheme, investor protection scheme and crisis management protocol. Islamic financial industry faces almost the same challenges when entertaining its customers. There are segment of risk-averse customers and risk neutral customers. At the customer side, the implementation of deposit insurance scheme and investor protection could reduce the potential liquidity crunch resulted from deposit runs. Although in concept, Islamic banking depositors are supposed to share the profit as well as the loss, in reality they still wish to have sufficient financial assurance. Some countries have included deposit protection scheme to both systems the conventional and the Islamic. However, some further development should take place to improve the mechanism which confirms sharia principles. There are two distinctive features that should appear in the Islamic deposit insurance scheme. First, the protection is not directly links to the deposit but more to relieve potential loss of the Islamic banking business activities. Secondly, the investment activities by the deposit insurance corporation should be on the sharia compliant financial instruments in order to justify the income. The financial authorities for Islamic banking system have to prepare the required infrastructure required, particularly where the Islamic banking operations is still far below the critical mass to achieve its operational sustainability. The legal interpretation can also be an issue to interpret the liabilities to the customers when the guarantee is given to the instrument which is supposed to apply sharing contract according to sharia principles. This issue is addressed implicitly in the capital adequacy standard by the IFSB which introduce the alpha factor as the proxy to estimate the potential liabilities levied to the Islamic banks which eventually will go to the deposit insurance corporation. In some Islamic finance operating countries, the deposit insurance scheme has been a standard practice; although, some adjustments need to take place. In conventional practices, the banks pay some amount of premium the Deposit Insurance Company (DIC) and then, the DIC invest that premium in some investment portfolios. There exist two conflicting problem when it comes to the Islamic banking:

i. In order to minimize adverse selection problem, the authority sets a ceiling premium rates for deposit (in case of flat rate scheme). The banks that entertain the customers with deposit rates higher than the ceiling rates will be excluded from the deposit protection scheme. On the other hand, the returns given by the Islamic banking is based on the actual financial performance. The higher the financial performance of an Islamic bank, the higher the return is given to the investors. There is a need to set out a risk-sensitive premium rate applied for the Islamic banking so that the system can still minimize the potential adverse selection problem and at the same time provides incentives to the bank to perform well.

ii. The deposit insurance scheme needs to separate the Islamic assets from the conventional. It will allow the DIC to invest the premium taken from the Islamic banking to the Islamic compatible instruments.

On resolution process, the Islamic banking should also be equipped with adequate procedures to deal with problem banks and sound exit mechanism that is capable of minimizing contagion effect to other Islamic banks.

Liquidity has become very important to improve its operational efficiency and the confidence of the customers as the ultimate points of the financial services. To anticipate the unexpected but plausible event, the Islamic financial system should also be equipped with proper set of crisis management protocol outlining the mandates of the related financial authorities to formulize inter sector emergency financial policy in an extreme financial condition and the policy actions could be set out of the existing regulations. However, the protocol should define the criteria fulfilling the extreme financial conditions agreed by other related institutions, including even the parliament.

Aspects of financial safety nets

Financial safety net arrangement is aimed at preventing potential failure of individual financial institution leading to systemic financial disruption and broader economic problem. The arrangement covers 3 important areas: a framework for liquidity support, deposit insurance plus investor and policyholder protection schemes, and crisis management policies.

Frameworks for liquidity support

Liquidity is one of key elements to support the operational sustainability of the financial system. Normally, the central bank provides emergency liquidity facility in terms of lender-of-the-last-resort (LOLR) applicable for conventional and Islamic banks as the systemic financial buffer against temporary disturbance in the financial market.

Deposit insurance

Deposit insurance scheme can serve as the last line of defense for the customers in the financial market. In an adverse condition, the customers of the banks assume the first come first serve basis providing better chance for the customers who withdraw his money earlier. Normally, deposit protection scheme does not cover the whole value of the public funds deposited in the banking system. The Basel Committee and International Association of Deposit Insurers (2009) have released a set of core principles for effective deposit insurance systems. The concept of deposit insurance has to also cover the Islamic banking since it is also vulnerable to experience deposit runs because of idiosyncratic disturbance. Practically, an effective deposit insurance scheme for Islamic finance needs to be supported by clearly defined concept of solvency regime.

Investor and policy holder protection scheme

The investor and policy holder protection scheme becomes more intent in the Islamic finance with the presence of share based instruments. Most of the protection schemes are designed to provide compensation arising from fraudulence practices or other malfeasance in an absolute term or as a proportional of the loss incurred. In most cases, investor protection scheme has become a statutory and set as a separate companies administered by the regulator of the market. The scheme should promote good governance practice and minimize the potential of having moral hazard problem.

Ultimately, this protection scheme helps to level the playing field across different sectors. In order to address this issue, the IOSCO (2003) has issued objectives and principles of securities Regulation that put this protection scheme in the principles.

Crisis management

Financial policies should be set based on two possible conditions: normal business and during the period of crisis. The financial crisis may be caused by natural disaster or other idiosyncratic failures that can adversely affect the financial system. Islamic financial institutions are not immune and could adversely be affected by the crisis. The CMP covers the steps to identify potential threats to the financial stability which are sourced from problems in the general banking industry, currency vulnerability, interest rate and other possible indicators leading to the financial crisis. The CMP should be equipped with threshold function in defining the financial crisis since each country would have its own structure and characteristics that determine the level of financial resilience when facing a significant turmoil. In general, the establisment of CMP is aimed at two objectives. First, the CMP serves as the anticipatory action to maintain the operational soundness of the financial system even if it operates under a significant financial pressure so that the intermediary function can always be performed. Second, the CPM should promote possible prompt corrective actions to stabilize the system whenever necessary. In order to make the CMP effective, there are a few steps that are worth considered to be taken as follows: business continuity plan (BCP), framework for coordination, early warning system, and stress test.

Islamic banking supervision

The Islamic banking industry has IFSB as its international regulatory standard setter to equip the industry with sufficient standards. Technically, the Islamic banking industry can benefit from the current development in taken place in the conventional industry. Majority of the regulatory framework can still be applicable to the Islamic banking operations like the 25 BCPs that have been internationally adopted.

Group 1 – principle 1 - the standards needs to address the position of fatwa authority within the banking industry contributing to the legal certainty in a case of dispute. There should be clear definitions on the banking authority that governs the whole aspects of Islamic banking issues, including sharia compliance issue. The dispute settlement mechanism needs to put a proper process that is pro-efficiency and avoid unnecessary cost to the transactions. Group 2 - principles 2 - 5 - the standards need to defineIslamic banking permissible activities that in some particular areas it might be incompatible with the conventional counterpart. Islamic banking allows the operation of mutual fund within the banking activities whilst, it is classified as a capital market activities. On the licensing activities, the Islamic banking authority needs to consider sufficient knowledge of sharia banking by the top management and the shareholders of the bank to minimize the operational risk (particularly regarding the sharia compliance aspect) besides the general banking activities like financing, money transfer, maintaining deposits, etc. Like any other companies, the Islamic banks ownership is transferable through acquisition process. Therefore, the transfer of ownership needs to go through a thorough examination process. The authority should also assure that competent persons having high integrity are in place to run the business. Group 3 – principles 6 – 18 – the Islamic banking can follow the Capital Adequacy and Risk Management Standards set by the IFSB. The standards have accommodated the Islamic financial instruments in the Risk Weighted calculation and set out the definition of capital applicable to the Islamic banking operations. Although, it still adopts the standardized approach using a riskslotting menu in determining the level of credit risks. In the prudential measures, particularly in the risk management standard, the Islamic banking industry can follow the standards set by the BIS. The Risk Control System (RCS) applies both to Islamic banking and conventional. The differences are mostly taking place in the product interpretation process. Islamic banking has different types of products that need to translate it into the same payoff curves and risk building blocks. For example, the assessment of the credit risk on the mudharaba contract requires a correct understanding on the contractual arrangement to define the state of default, the probability of default and the residual value, which eventually determines the price of the product. The same approach goes to other types of risk i.e. market risk, liquidity risk and operational risk. The Islamic banks may not have a direct impact on the interest rate risk. since does not have interest based instruments that adjust the price of the instruments contractually like interest based derivatives. However, the changes of interest rates in the market may give effect to the demand of the instruments since the investment vehicles do not differentiate the segment of the market. On the liabilities side, the changes in interest rate may also influence the appetite of the investors to put their money in the Islamic banks. In order to maintain the liquidity, the Islamic bank may adjust the returns to the investors to keep them loyal to the bank. Group 4 – principles 19 – 21- the supervisors of the Islamic banking may use the BIS standards in formulating a proper supervision strategy that consists of reporting system, techniques and approaches. The on-site and off-site supervision have been a standard practice involving comprehensive reporting system to reflect the actual financial soundness of the Islamic banking institutions. The supervisors use the on-site supervision to verify the information reported through the off-site reporting system and to have a closer look on the particular problem in a more focus way. The Islamic banking system may complement the reporting system with sharia compliant aspects in assuring the Islamic banks operate within the sharia principles. Group 5 - principle 22 - the Islamic banking uses the internationally recognized accounting standards (IAS) and financial reporting (IFRS) complemented by the AAOIFI standards to capture the Islamic financial transaction more appropriately. As matter of fact, the AAOIFI standards were developed in compatibility with the IAS standards. Group 6 - principle 23 - the Islamic banking may use the BIS standards in formulating corrective and remedial power of supervisors. Group 7 principles 24 to 25 - Islamic banks may be a part of conglomerate business and conduct international operations. The supervisory activities should be able to perform consolidated supervisory activities capable of capturing potential risks resulted from financial and non-financial activities within the same business group. Besides, the supervisory framework applied should be able to define responsibilities shared between home and host countries when it comes to the cross border banking activities

Assessment of insurance supervision

Similar to the Islamic banking industry, the takaful industry may also benefit from the current development in the insurance industry by adopting relevant principles of the insurance supervisory framework. The table summarizes the areas peculiar to the takaful practices taking assumption that almost international insurance standards are applicable to the general takaful industry.

Group 1 – principles 1 to 4 – the standards needs to address the position of fatwa authority issuing the sharia standards applicable to the takaful activities. At the operational level, the supervisors have also responsibility to assure the sharia compliance besides the prudential issues. Group 2 – principles 5 to 8 – the standards

needs to define the scope of business activities which are sharia compliant. The scope covers takaful contribution collecting process, investment process and operational management. Consequently, the persons running the business activities should have an adequate capacity in terms of prudential measures and sharia compliant issues, and integrity. This includes the possible transfer of controlling parties that could potentially change the policy direction of the companies. The existence of tabarru pools is unique to the takaful industry; hence, the takaful operators need an additional guidance in managing the funds to minimize potential moral hazards in the usage of the funds. Group 3 - principles 9 to 12 - the standards need to address the corrective actions taken in the area of sharia compliance to minimize the violation of sharia rules. One of the possible corrective measures is to combine the suasion and the financial penalty as the enforcement factor since the deterioration of the public confidence may result in financial loss. The same as the insurance industry, the takaful authority should have a sound exit policy allowing an exit process without causing unnecessary contagion effect to the system as a whole. Group 4 – principles 13 to 17 – Operationally, takaful operators may have different products and structure (like tabarru funds). The takaful industry may apply the same prudential standards to achieve operational soundness contributing to the operational sustainability at the institution level and systemic stability such as the use of solvency ratio (capital adequacy) and other methods relevant to the risk assessment process. Group 5 – principles 18 to 21 – the takaful industry may use the same principles plus additional items on the disclosure material containing additional sharia compliance reports and additional business conducts. The IFSB has issued a standard guidance on the conduct of business for Islamic financial institutions, including takaful operators. The implementation of conduct of business is supposed to be borne by the commitment of the industry. It does not have punitive action at the event of violation. Group 6 - principles 22 - the industry may implement the same ICPs standards in the area of anti-money laundering and combating the financing for terrorism since there is no sharia issue involved in the analysis. A full adoption of this standard would improve the profile of the takaful industry in term of financial integrity internationally. Group 7 - principles 23 to 24 - the main issue on the group wide supervision and macro-prudential surveillance is the compatibility in the reporting system so that the consolidated figure represents the financial position and performance accurately. Financial conversion process may be required to facilitate the consolidation process to converge the interpretation. Group 8 - principles 25 to 26 - the takaful supervisor would need to develop cooperation domestically (with other financial supervisory agency within the country) and to achieve mutual understanding between host and home countries particularly in the area of sharia interpretation. In some cases, different interpretation on the sharia aspect may lead to different assumptions in the Islamic financial contract such as insolvency regime in the Islamic financial transaction

Assessment of securities market regulation

Islamic capital market basically plays the same function as the other capital market except for the sharia compliant issues. The sharia compliant issues cover the restriction to certain prohibited business activities and financial instruments containing interest bearing concept and speculation. The Islamic capital market serves as melting point facilitating the investment activities between the investors and the capital holder efficiently. A review has been done resulting in the conclusion that IOSCO principles are applicable to the Islamic securities market with some recommendation. Generally the recommendations touch the areas of the recognition on the sharia principles into formal regulation giving the authorities the power to deal with sharia compliance issue. These recommendations are to minimize the sharia compliance risk that may disrupt public confidence to the Islamic segment of capital market. The recommendations cover the regulatory instruments relating to the prudential measures, reporting framework, and entry policy ensuring the intermediary has the relevant competencies in Islamic finance.

Group 1 – The principles relating to the regulator (1-8) set out the status and the position of the regulator. The principles state the important of having the operational competence and independence to arrive at the highest professional standards. Like other financial regulators, the capital market regulators should also be supported by a clear defined legal framework to assure its effectiveness of the regulatory process. The relevance to the sharia issues covers the regulatory power over the sharia compliance aspect, the consistency over the sharia interpretation and the capacity of the regulators to understand the sharia principles. Group 2 – The principle for self-regulation (9) sets out the framework of self-regulatory organization involving some direct oversight responsibility and observing standards of fairness and confidentiality. The same principle is applicable to the Islamic system. Group 3 - The principles for enforcement of securities regulation (10-12) set out comprehensive supervisory tools to ensure the enforcement of securities regulation covering inspection, investigation and surveillance. The regulators should be able to ensure the sufficient level of compliance of the companies to the regulatory framework set by the regulator in order to achieve sufficient level of investor protection including the inspection over sharia compliance issue and the power to rectify any possible incompliance problem. Group 4 - The principles for cooperation in regulation (13-15) set out the framework for cooperation with other domestic regulators and other regulator in foreign countries in the areas of information exchange and operational assistance in the discharge of their function and exercise of their powers. However, different jurisdictions may have different interpretation over sharia principles that give different implication to the application technically. Therefore, mutual recognition by home and host supervisor is very important. Group 5 - The principles for issuers (16-18) set out the basic requirement should be fulfilled by the issuers. The requirements include accurate and timely financial reports for disclosure purposes, adherence to the international accounting and auditing standard so that the investors are treated fairly and in equitable manner. All types of risks should be represented objectively in the financial report. In order to achieve a sufficient level of compatibility, the convergence of financial reporting system between the conventional and Islamic financial reporting is important. Group 6 - The principles for auditors, credit ratings agencies, and other information service providers (19-23) set out the regulatory requirements for adequate level of oversight on the auditing companies, credit rating agencies and other entities offering financial analysis services. The requirements are meant to assure that the investors have unbiased and accurate information about the market arriving at greater confidence over the market. These institutions are subject to registration and periodic review by the supervisory authority. Group 7 - The principles for collective investment scheme (24-28) set out the regulatory requirements for collective investment activities. The requirements include the legal foundation, structure of collective investment scheme, disclosure, asset valuation redemption process and assurance that the companies invest in sharia compatible instruments. Group 8 - The principles for market intermediaries (29-31) set out the regulatory guidance for market intermediaries in order to protect the interests of the clients. There is a need to prescribe prudential requirement reflecting the level of risk undertaken by the intermediary companies and its responsibility, particularly when dealing with failure of the market intermediary containing systemic risk that could possibly creating instability. Operationally, the intermediary companies should also sufficient knowledge about Islamic finance to minimize reputation risk and to ensure that the intermediary companies apply sharia compliant risk management techniques. Group 8 – The principles for secondary market (33-38) set out the regulatory guidance for the establishment of the secondary market. The regulatory principles should be able to promote transparency minimizing the potential of having manipulative practices and unfair trading activities. Besides prohibiting usury, the Islamic finance also prohibits unproductive speculative activities which try to gain financial profit out of speculative transactions which do not reflect the real economic activities. Operationally, the liquidity in the Islamic financial market is also important which may offer benefits to the market players to gain more efficiency in the liquidity management. However, excessive liquidity can also built out of speculative financial transactions that may make the financial market more vulnerable against market disturbance. The Islamic financial authority may prescribe an alternative mechanism to facilitate the financial transactions which are compliant with sharia principles.

The guidance principles also cover the oversight of large exposures and the settlement of securities transactions to ensure the fairness, effectiveness and efficiency. All the prudential frameworks set to the capital market are expected to reduce the systemic risk and promote sustainable economic development. The link between observance of the 38 principles and market development and stability is very important. The implementation of the 38 principles needs some preconditions to be met including company law, established contract law, clear tax law, bankruptcy law, banking law, competition law and efficient judicial system

4.4. Assessing the supervision of other financial intermediaries

Non-bank Islamic financial institutions

Conceptually, standalone-low-leveraged finance companies do not need intensive supervisory framework since they operate with their own financial sources. Any operational failure of this financial institution will not create systemic implication and any transactional disputes fall under common commercial law. There is no immediate impact resulted on the financial stability although some significant impact on the productions can also trouble other production sector within its production chains. Currently, the ability of the financial authority to expand its supervisory activities to the non-bank financial institutions is very important when it comes to the assessment of the cross-sector wide conglomerate financial activities. The risk based capital adequacy assessment takes into account the financial soundness of the Islamic banks, takaful and other highly supervised institutions. Islamic financial institutions should address the same importance for conducting consolidated supervision to minimize the myopia when assessing a group-wide financial soundness.

ZISW institutions

In most Muslim countries, the development of Islamic social institutions has just reached the infancy stage. Currently, almost no regulatory framework exists in a comprehensive way to optimize its presence in supporting the economic development. However, some countries have started to equip the institutions with stronger legal foundations by ratifying Zakat and Waqaf acts as the basis for their operations. So far, there has not been an international effort to set out guiding principles for zakat and waqaf operators as well as the supervisory authority to operate soundly.

Zakat-Infaq-Sadakah institutions

Despite the slow pace of development, some countries have taken serious steps to establish the legal foundation for zakat operators. The areas of regulation cover the objectives of the establishment that emphasize the development roles in the economic development, the activities of the institutions, reporting system and possible punitive actions taken in the case of violations to the zakat regulations. Financially, the operational failure of any zakat institutions will not create systemic disturbance since the funds collected by the zakat institutions is non-claimable. However, the Islamic financial system succeed in mobilizing the zakat funds, the outreach of the system will improve very much since it is low cost and can sustain the basic consumption of the poor even in the period of economic downturn. The purpose of the regulatory and supervisory framework is to minimize the potential misuse of the funds and improve the public confidence in performing one of the important religious duties at the economic front. At the macroeconomic level, the presence of zakat system can damp the economic volatility since the consumption level can always be maintain, providing opportunity to the production sector to still operate during the period of recession. The zakat system can equip the financial system with effective measure for financial inclusion program. Some human capital development programs need to be developed to achieve operational effectiveness in distributing the funds which is beneficial to the poverty alleviation program. In some countries, the zakat fund is also used for working capital of the poor when they start up the business. Some of the fund also is allocated to sustain health program for the poor in terms of free medication and the development of health facility like small hospitals.

Waqaf institutions

Different from zakat, infaq and sadaqah institutions, the management of waqaf funds needs to maintain the value of the funds remains the same and all the assets managed should be allocated according to the statements of the waqaf providers when it was submitted to the management. As mentioned earlier, types of waqaf may vary from fixed asset waqaf (like lands, houses and buildings) to cash waqaf. The designation of the waqaf can also be time infinite or fixed term which is callable when the period ends. Some countries have already ratified waqaf act to provide stronger legal foundation for the waqaf management to allocate the usage of the waqaf assets effectively. The Waqaf Act defines the basic activities of the waqaf funds and all the relating parties engaged. The waqaf institution is set up as an independent body that is free from vested interest and audited externally to assure that the institutions are well-managed. The asset of the waqaf institutions should be properly registered and managed so that the value of the funds managed will not be looted or mismanaged that could result in the decrease of the net value of the waqaf funds.

4.5. Rural and microfinance institutions

Despite the simplicity of the regulatory framework, the regulation applied for microfinance institutions may include legal registration, regular financial reporting representing its financial performance, regular reporting of conduct in business operations, and securing proper license. An international initiative has been done to address the issue on possible standard guidance applicable to micro finance institutions under the Consultative Group to Assist the Poor (CGAP). The initiative has been successful to release guiding principles on regulation and supervision of microfinance institutions. Generally, the guidelines consist of two types of regulations: non prudential regulations and prudential regulations.

Non-prudential regulations set out the basic requirements supporting the environment supporting to an efficient microfinance activities, particularly to non-banking microfinance institutions which have very limited regulatory framework. The non-regulatory regulations cover the legal foundation allowing the companies to extend their facilities legally, good governance and business conducts, support on the macroeconomic policy (including interest rate ceiling and special tax treatments), and transformation mechanism. Islamic microfinance institutions may benefit from the current development in the microfinance regulatory framework. Like the Islamic banking industry, Islamic microfinance institutions, particularly to those collecting public deposits, need to always maintain its solvability level high. The depositors of the Islamic microfinance behave like the banking depositors. However, due to its size, the prudential regulation should be kept as simple as possible to minimize the regulatory 'cost' without sacrificing the prudential measures. Most of Islamic microfinance institutions operate under cooperative framework opening up wide opportunities for the public to participate as shareholders besides collecting public deposits. Besides sharia related aspects, Islamic microfinance industry can still adopt the CGAP regulatory framework. The peculiarities to the Islamic microfinance lie upon the recognition of Islamic modes of finance, the adoption of the Islamic accounting standards and the price limit set whilst the rest can still be adopted fully.

Non-bank microfinance institutions, in much simpler structure, resemble the banking institutions; therefore, some of the prudential regulations are similar to those of the banking industry. The prudential regulations put much of emphasize on solvency level and the quality of the exposures. The solvency level is indicated by the minimum capital and capital adequacy ratio. The regulations relating to the guality of exposures cover provisioning, documentation, governance structure (supported by monitoring and reporting), concentration risk, and liquidity position. The guideline principles also put one pillar to state the importance of deposit insurance scheme for microfinance industry. In order to simplify the supervision process, the guideline provides an alternative supervisory process by using a well-managed commercial bank as the apex to assure the business activities are conducted efficiently as well as prudently. Like the conventional counterpart, the Islamic microfinance can adopt the prudential standards for Islamic banking but in a simpler version which put emphasize on the solvability level and the quality of exposures. The Islamic microfinance can adopt the existing regulatory framework relating to the quality of exposures cover provisioning, documentation, governance structure (supported by monitoring and reporting), concentration risk, and liquidity position. The monitoring system should also contain the sharia compliance aspect to assure public confidence maintained high.

4.6. Assessing financial system integrity – Anti Money Laundering/Combating the Financing of Terrorism

Anti money laundering and combating terrorism is considered as a part of good governance which is beneficial in strengthening financial sector supervision and promoting better integrity of the international financial system. The AML/CFT tries to minimize the illegally obtained money and investments activities through an outside party to conceal the true source. The AML/CFT is mutually complementing with a wide range of United Nations conventions and resolutions promoting international cooperation in preventing and containing drug trafficking, organized crime, corruption, and efforts to finance terrorism. It covers the whole financial institutions including bureau the change, wire remittance transfer, cash couriers, insurers, brokers and traders) and also nonfinancial business and professions like lawyers, accountants, and trust and company

service providers. Operationally, the financial institutions should practice core principles to enhance know-your-customers (KYC) rules, suspicious transactions reporting, and other due diligence requirements helping to support the AML/CFT regimes. The AML/CFT has been an international initiative and adopted in the various international standards like Basel Committee on Banking Supervision (BCBS), International Association of Insurance Supervisors (IAIS) and International Organization of Securities Commissioners (IOSCO). The BCBS has recognized the money laundering issue in 3 documents: statement on prevention of criminal use of the banking system for the purpose of money laundering, 25 BCPs and customer due diligence for banks. The IAIS has issued guidance paper 5 regarding AML notes for insurance supervisors and insurance entity. Parallel with the 2 standard setters, the IOSCO has also issued a resolution on money laundering to be implemented by the securities regulators in each individual country. The adoption of the AML/CFT is considered important to improve the financial stability since the money laundering activities could create an adverse impact to the country macroeconomic performance, national reputation and cross-border externalities. A country with strong indication of money laundering activities may have less potential to attract foreign investment and more volatile to international capital flows and exchange rate. Internally, money laundering may also distort resource allocation and distribution of wealth. In most cases, it is costly and time consuming to eradicate the money laundering activities. After all, all economic and financial transactions are based on trust wherein the government needs to keep its integrity at all times. The government should ensure that the existing legal foundation provides legal power to exercise necessary actions such as freezing, seizing and confiscating the proceeds of crime and terrorist funding on the widest range of institutions (financial and non financial institutions). The law and measures also need to assure the international cooperation. Some preconditions that need to be in place in order to make the implementation of the AML/ACT effective include among others: the implementation of transparency and good governance, sound financial sector policy and infrastructure, appropriate measure for combating corruption, high ethical and professional requirement of the supporting institutions such as court system, and AML/CFT culture.

4.7. Assessing the legal infrastructure for financial system

The operational soundness and sustainability of the financial system heavily depends upon the legal foundation assuring legal rights, predictability, and fair and impartial enforcement of rules and regulations. In general, the legal infrastructures cover the central banking operations and the law regulating banking, non banking operations and the markets. From the financial sector perspective, the financial regulation cover central banking law, banking law, capital market law, etc. In a broader term, those regulations also cover insolvency regime and creditor rights, financial safety nets, ownership, contracts, contract enforcement, accounting and auditing, disclosure, formation of trusts and asset securitization, and etc.

Financial sector legal infrastructure

When establishing legal foundation, the Islamic financial system may need to establish new acts like Islamic banking act, takaful act, and zakat and waqaf act. In some particular areas, the Islamic financial system may still use the existing legal infrastructure with some modifications or amendments like central bank act, payment system act, governing law for government debt management, capital market act and financial safety net act. One of the main objectives of establishing new governing acts is to provide more space and flexibility for development where the Islamic finance has some operational distinctive features.

- 1. Central banking law should define mandate of the central banks to conduct monetary policy by using Islamic instruments and channels. The mandate should also allow the central bank to facilitate the Islamic financial institutions to get a Lender of the Last Resort facility when the market is struck by unexpected liquidity crunch.
- 2. The recognition of the Islamic banking activities is stated either in the existing banking act or separate Islamic banking act. The banking act should define the operational activities of the Islamic banks including the products and services, the power to regulate and to supervise according to prudential guidelines and well translated sharia principles.
- 3. The payment system act should state the mandate to facilitate financial transactions of the conventional markets and Islamic financial market, and to develop necessary infrastructure for Islamic financial market whenever necessary.
- 4. The governing law on government debt management should state the mandate to issue government fiscal instruments both conventionally as well as through Islamic instruments. Regular issuance of local government bonds (sukuk) can also be used as one of liquidity and monetary instruments.
- 5. The capital market act (facilitating Islamic instrument and conventional or separate Islamic capital market) should state the Islamic capital market operations covering the Islamic capital market products, modes of transactions and sharia related governance besides the common regulatory framework generally applicable.
- 6. The recognition of the takaful industry is stated either in the existing insurance act or separate takaful. The act should define the operational activities of the takaful institutions including the products and services, and the regulatory powers.
- 7. The governing law of financial safety net should formally include the Islamic financial system allowing the related authorities to react against unexpected financial shock.

Just like the conventional counterpart, Islamic financial system requires other supporting laws including commercial laws, creditor right and insolvency system, access to credit and land rights, and supporting judicial system.

- 1. Commercial laws normally facilitate general commercial business transaction which inspires other business related laws such as company law, etc. The amendment is aimed at recognizing sharia based transactions formally as another acceptable basis of commercial contracts.
- 2. The adoption of profit and loss sharing contract, including its derivatives like hybrid contract has to be accommodated when defining the creditor rights and insolvency regime. This will be the basis of the bankruptcy concept, solvency regime and deposit insurance scheme.
- 3. Judicial system refers to the efficiency and effectiveness of dispute settlement system which also recognizes the sharia principles.
- 4.8. Assessing information and governance infrastructure

The assessment on the information infrastructure covers 3 main areas. They are the framework for monetary and financial policy transparency; the accounting and auditing framework that helps to define and validate the information that is disclosed to the public

and the regulatory authorities, and the arrangements to compile, process, and share information on financial conditions and credit exposures of borrowers and other issuers of financial claims.

Monetary and financial policy transparency

The central bank plays its function as the monetary authority controlling (i) the money supply, (ii) availability of money, and (iii) cost of money in order to attain a set of objectives oriented towards the growth and stability of the economy. The policy making rests on the relationship between the cost of money in an economy and the total money supply. Through a variety of controlling instruments, the central bank tries to influence and optimize the economic outcomes covering economic growth, inflation, exchange rates with other currencies and unemployment. The central bank holds a monopoly of money issuance and has all power to alter the money supply and thus influence the interest rate and eventually achieving the ultimate economic goals. In order to perform this function, the central bank as the monetary authority must have a credibility in the market which make private agents believe that these announcements will reflect actual future policy. If the monetary authority believes that private agents anticipate the low inflation, it will provide incentives to the market by adopting an expansionist monetary policy and vice versa. Besides the technical capabilities, the central bank should be able to show its independence and transparency since lack of clarity can serve to lead policy away from what is believed to be the most beneficial. The IMF has issued a document providing guidelines to the monetary authorities to gain it credibility from the public. As a part of financial industry, Islamic financial institutions may also be used as channels for monetary transmission by using sharia compatible financial instruments, particularly when the size of the business of the Islamic financial system becomes significant. The central bank might use sharia compatible central bank certificates in order to complement the existing central bank certificate applicable for conventional banking institutions or other instruments which are potential to be used as Islamic monetary instruments like government sukuk.

Pillars no 1 to 4 mention about the clarity of roles, responsibilities and objectives of central banks for monetary policy that should be well-defined in the legal documents; the openness to the public about the process for formulating and reporting monetary policy decisions in order to gain public confidence; the level of information dissemination to the public about the monetary policy; and, the methods how to set criteria of the accountability and assurance of integrity by the central bank. The laws should explicitly give mandate to the central bank to conduct monetary policy using 2 possible channels of monetary transmission resulting in clear monetary signals to the market effectively. Pillars no 5 to 8 mention the requirements for other financial agencies supporting the effectiveness of the monetary operations. The same as those for the monetary authority, there is a need to have clarity of roles, responsibilities and objectives of financial agencies; openness in formulating and reporting of financial policies; publicly available information on financial policies; and, accountability and assurance of integrity by financial agencies. The positions of regulatory authorities of the Islamic financial system should be clearly defined. Each country may have different approaches towards the supervisory structure. Some may adopt the single peak approach (the combination of the supervisory functions under one single roof) and some may separate the supervisory authority for bank and non-bank institutions (including securities market). The Islamic financial institutions report their financial position in a compatible structure to the conventional so that the consolidation process can be done easily. In order to fulfil the requirements as one of the monetary instrument, the government sukuk should be issued regularly in the local currency and traded with a sufficient level of liquidity.

Accounting and auditing assessments

The assessment of the financial soundness is based on the financial assumptions and standards set in the accounting standards. Therefore, a core component of good corporate governance is an accurate disclosure based on high quality accounting and auditing standards. The assessment process reflects the adoption of such accounting standards which serves as a precondition to support effective supervisory framework. Moreover, financial disclosure is very important for informed financial decision, effective resource allocation and effective functioning of the market. Inability to implement such accounting standards very well can reduce the ability of the supervisory authority to filter out the sound financial institutions from the unsound ones. This becomes important especially when the condomeration exist which requires consolidated supervision in place. These accounting and auditing standards which have been developed by the International Accounting Standards Board (IASB) evolve over time. Currently, there are 36 effective IAS-IFRS standards, with 11 interpretations, addressing the generalpurpose financial statements designed to meet the needs of shareholders, creditors, employees, government agencies, and the public at large for information about a public entity's financial position, performance, and cash flows. Some of the standards of IASs and IFRSs are very important in the financial sector assessment process. The IAS 1 deals with the content of financial statements generally. The IAS 30 sets out requirements to the disclosures by banks and other similar institutions of their income statement, balance sheet, and contingencies and commitments, including other offbalance sheet items. The IAS 32 and IAS 39 set out requirements on the recognition, measurement, and disclosure of financial instruments.

For the auditing purposes, there are 33 ISAs, accompanied by a "Code of Ethics for Professional Accountants" and other related engagement standards. Some auditing standards relevant to the financial industry include ISA 220, 230, 240 400, 520 and 700 setting out the quality control, documentation, responsibility to consider fraud and error, risk assessments of internal control, analytical procedures, and the auditor's report on financial statements respectively. Like the accounting standards, the IASB and the IFAC's IAASB constantly revise and update the standards to reflect current trends and issues in financial reporting and auditing, which reflect globalization, capital flows, regionalization, technology changes, and so forth. In order to promote the global adoption of the standards, the World Bank has developed a program relating to the FSAP-ROSC focusing on the institutional framework, comparability of national and international standards, compliance with national standards, and action plan by the respective countries. The Islamic financial institutions need to adopt internationally recognized accounting and auditing standards as well as accommodating the transactional uniqueness of the Islamic finance. The AAOIFI has issued a number of documents covering accounting standards, auditing standards, governance standards and sharia.

The AAOIFI has already issued 26 accounting standards covering the very basic objectives of the financial statements of the Islamic financial institutions which are compatible with conventional international accounting standards. Some countries have already adopted the AAOIFI accounting standards into their national accounting standards for the adoption by the industry besides keeping the IASB accounting standards wherever required. Each country may decide different level of adoption

towards the AAOIFI standards depending upon their readiness of the country to really translate and harmonize the AAOIFI standards into their existing accounting standards. The accounting standards have also been complemented by the auditing standards. The auditing standards put emphasize on the sharia aspects besides common auditing process. The AAOIFI standards on governance put more emphasize on the roles of sharia supervisory board which distinguish the Islamic financial institutions from other financial institutions.

The AAOIFI have also issued documents relating to the sharia standards which serve as underlying principles for Islamic financial instruments. However, the adoption of sharia standards is subject to the approval of the ulama council in each country whether the standards confirm their sharia interpretation. Eventually, the financial authorities operating Islamic financial system should be able to declare the accounting regime adopted in the system to avoid misconception when interpreting financial reports particularly when it comes to group wide consolidated figures.

Credit reporting system and financial information services

Credit reporting system has become a formidable tool to minimize adverse selection problem which provides high quality credit information about the credit customers. Ideally, the system is fueled by data from banks, other financial intermediaries, private firms, retailers and others. They share certain accurate and reliable information which is exchangeable one another through rapid access system to support a well-functioning credit market. In order to maintain the quality of the information, the credit reporting system should meet certain technical criteria: the system must be open, the data collection covers positive and negative information, data maintenance is kept for a reasonable timeframe, and the data should be up-dated real time. Practically, the data reporting system should be governed by several legal foundations covering law on bank secrecy, data protection law, consumer protection, fair credit and consumer credit regulation, and provision with respect to privacy and personal or corporate secrets in existing laws. It is used to support both onsite and offsite supervision, ultimately facilitate macro prudential surveillance since the supervisor has got an access to individual data. Islamic financial system would need the credit reporting system as a mean to minimize the adverse selection problem. The Islamic financial system can use the existing information system with slight modification relating to the data fields describing the classification of the Islamic financial products. In a wider horizon, efficient informational exchange among the Islamic financial institutions and conventional financial system can avoid the loophole potentially used by unsound customers to maximize their own benefits.

Corporate governance

Good Corporate Governance (GCG) provides positive impact to the operational efficiency of the companies since it harmonizes the relationship among the management, its boards, shareholders and other relevant stakeholders (including the communities). Operationally, the GCG can bridge the gaps between the management who runs the companies and the shareholders. At a broader term, the implementation of the GCG contributes to the financial stability and promotes market confidence and fosters market disciplines. The harmonization of the relationship covers the property rights of shareholders, the mechanisms of exercising and protecting those rights, and the way of ensuring a fair return. Those relationships are set based on proper incentive mechanism and effective monitoring activities. The GCG serves as one of the preconditions in achieving effective supervision which is mutually reinforcing with other

financial prudential standards such as BCPs, IOSCO and other standards. To address this importance, the OECD has issued OECD Principles of Corporate Governance outlining the four fundamental principles covering responsibility, accountability, fairness and transparency. The principles have been adopted as one of the 12 key standards for sound financial system by the Financial Stability Forum. The IFSB and the AAOIFI have issued documents relating to the practice of the Good Corporate Governance (GCG) although the emphasis is put more on the role of sharia boards. This confirms that the Islamic financial institutions may adopt the common standards of Good Corporate Governance for the general adoption complemented by the sharia board related standards. The same goes to the disclosure regime where Islamic financial industry should promote more market power to objectively govern the industry. For the Islamic financial industry which promotes the use of sharing based financial transaction, the transparency becomes very essential to reduce agency problem.

Disclosure regime for financial institutions

Market forces is very essential in supporting self-regulatory regime in the financial market and has become one of the important pillars in the international prudential standards such as Basle Standards and other supervisory standards although standard element of the financial disclosures have been covered in the IFRS standards. At the national level, disclosure standards are outlined in the banking laws, listing requirements of the securities regulations and applicable company laws. Practically, market discipline serves as an effective tool to limit excessive risk taking behaviour by banks covered up by the safety-net. Market discipline is important when the supervisory approach has shifted from the compliance based supervision to the risk based supervisory review. In particular, the pillar III of Basle II provides 13 templates to facilitate financial disclosure issue. The templates cover scope of application, capital structure, capital adequacy, credit risk (general), credit risk (standardized approach), credit risk (IRB approach), equity (banking book) positions, credit risk mitigation, securitization, market risk (standardized approach), market risk (internal models approach), operational risk, and interest rate risk in the banking book. The Islamic financial industry should encourage the convergence between IFRS and Islamic financial reporting.

4.9. Systemic liquidity infrastructure

Systemic liquidity is the setting of institutional and operational arrangement that provide first liquidity effect to the market players in achieving effectiveness and efficiency. This arrangement includes central banking, banking and other financial institutions. The market infrastructure involves the design and operation of payment systems and securities settlement systems, the design of monetary policy instruments and procedures for money and exchange markets operations, public debt and foreign exchange reserves management strategies and operations and microstructure of money, exchange, and securities markets.

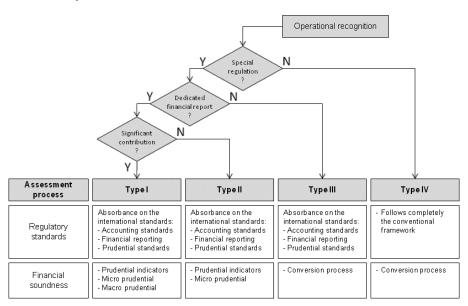

Islamic financial industry heavily relies on an efficient and reliable liquidity infrastructure consisting of payment system, securities settlement, monetary and foreign exchange settlement, government market securities and foreign exchange reserve management. It can benefit from the existing infrastructure which is already able to support operational efficiency. Technically, the newly established industry can use the Real Time Gross Settlement (RTGS) to provide the customers and the companies with more efficient payment system. The Islamic financial system may need the Delivery Versus Payment (DVP) type of settlement more than to the PVP (Payment Versus Payment) to facilitate

the exchanges of underlying Islamic underlying assets. The industry needs to also develop liquidity market that trades securities (including government securities). In most instances, Islamic financial market needs liquidity and flexibility to let the market participants achieve its operational efficiency.

5. The implementation

The level of presence of the Islamic financial industry varies in every country. In some countries, the industry has just reached an introductory phase, whilst in others the industry may have played a significant role in the economic development. There are possible 4 possible types of the adoption of Islamic financial system as illustrated in **Exhibit 5**. Type I represents the countries that allow the Islamic financial institutions to operate with full adoption of the conventional regulatory and supervisory framework. Type II represents the countries which adopt dedicated regulatory standards for Islamic financial industry without having dedicated financial reports which accommodate the operational differences of the Islamic financial transactions. In the type I and II countries, the financial authorities need to have conversion program that translate financial information into conventional reporting standards so that the financial figures can fit all the existing financial ratios and analysis. Type III represents the countries which already developed dedicated financial reports representing the actual Islamic financial transactions based on particular sharia contracts besides adopting dedicated regulatory standards.

Exhibit 5 The level of presence

Since the share of Islamic financial industry is still small, dedicated macro analysis is not exercised to compliment the national wide financial analysis. Type IV represents the countries which already have dedicated financial reporting, regulatory framework and significant contribution of Islamic financial industry within their national financial industry. The issue on the financial stability should also cover the Islamic financial industry as the complementary part of the macroeconomic analysis. The adoption of the regulatory framework depends upon the national discretionary.

initiative should also consider the conditionality of the assessed countries based on the optimality criteria in developing the regulatory structure and the infrastructure.

6. Conclusion

In order to achieve the operational soundness, the development of Islamic financial system needs to concerted efforts by the stakeholders internationally. The efforts may take place in several areas as follows.

- The development of further international regulatory standards by the international Islamic standard setters. In most instances, the development of Islamic regulatory framework may still use the existing regulatory framework wherever it still relevant. The development of the regulatory standards needs to also involve the conventional counterparts in order to build up mutual understanding between the two systems.
- 2. The development of appropriate tools for complementing the existing assessment framework is also needed since the assessment process should cover the whole financial system including the conventional and the Islamic. Therefore, the assessors should be equipped with sufficient knowledge of Islamic financial system, particularly when it relates to the financial stability issues involving financial ratios and infrastructures.
- 3. The implementation of the assessment process needs to consider the conditionality of the Islamic financial system. The Islamic financial system that significantly presents in one particular country needs a full range of assessment process. On the contrary, limited assessment process may be adopted to the countries that operate the Islamic financial system at the very early stage.
